

**CAUTION: REMOVE MAGAZINE AND VISUALLY CHECK CHAMBER TO MAKE SURE THAT FIREARM IS UNLOADED.**

JP MicroFit™ Takedown Pins are the ideal solution for a perfect receiver fit. As simple to use as standard AR takedown pins, MicroFit™ pins allow a customized fit for receivers that fit too loosely or those that are too tight due to buildup of finishes like Cerakote.

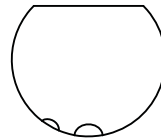

For each platform, seven possible arrangements of pins are possible with the current selection of MicroFit™ pins. In most cases, matched pins (e.g., standard-standard, oversized-oversized, etc.) will make for the best fit. Our standard pins are run to industry standard sizes (Mil-spec in the case of the AR-15), while the oversized and undersized pins run slightly larger and smaller, respectively. These pins can be identified by the markings on their heads:

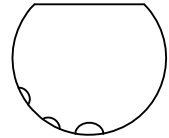

**UNDERSIZED**

**STANDARD**

**OVERSIZED**

**EXTRA  
OVERSIZED**

If you are looking to gauge the fit of your third-party receivers, you can determine your fitment using standard takedown pins or gauge pins. For the AR-15, Mil-spec pins are roughly equivalent to a .248 gauge pin. For the AR-10, standard pins are roughly equivalent to a .278 gauge pin.

MicroFit™ Takedown Pins install exactly like standard takedown pins. You can use the same springs and detents from your existing pins or those supplied in a lower parts kit. To prevent scratching your receivers, MicroFit™ pins also feature a recessed area to allow for easy tool seating when removing the pins.

**THANKS FOR YOUR BUSINESS!**
